HETRONIC

ERGO MFSHL

The HETRONIC **ERGO MFSHL** series was designed to serve the short-range market of professional radio remote controls. It's engineered to control a limited number of digital functions without sacrificing safety and reliability. The **ERGO MFSHL** offers competitively priced high reliability and high quality.

The Design:

All **ERGO MFSHL** transmitters are powered by 3 AA batteries which allow for up to 500 hours of operation. Its ergonomically designed profile allows for easy single-handed operation. The highly reliable membrane switches are available in single, double and triple speed.

In its standard configuration, the system comprises an Emergency-Stop switch as well as a Key-Switch. The housing is compact yet rugged and several different configuration standards are offered for "off-the-shelf" availability.

Applications:

Like most Hetronic products, the **ERGO MFSHL** series fits a broad variety of applications. It's ideal for chain hoists, small overhead cranes, conveyor systems, monorails, hook loaders, concrete mixers, tow trucks, tailgates and many other types of machinery.

The **ERGO MFSHL** transmitters are fully compatible with Hetronic's line of MFSHL receivers.

H-LINK:

H-LINK is an intuitive and user-friendly software that runs on a PocketPC. It provides remote access to the settings and parameters of the radio remote control. Individual settings are accessed and configured using the PocketPC and then uploaded wirelessly, via the HETRONIC H-LINK modem to the transmitter or receiver. In short, the configuration of a radio remote can be changed or customized from a distance of up to 20 meters (60 ft)!

MFS:

The MFS feature enables up to 20 transmitters to be operated in close proximity while sharing the same frequency. Therefore, operators don't have to worry about frequency management.
